

5 ABSTRACT

 A method and kit for providing a cap panel and accessories for a casket comprises a panel
of flexible plastic or board that is covered in a removable fabric. The lid of the casket where the
cap panel will be displayed is measured using an included measuring device, and the panel is cut
to adjust the panel size after removing the decorative fabric. After adjusting the size of the panel,
10 the panel is re-covered in the fabric by attaching the fabric at the backside of the panel.
Thereafter, the panel is inserted onto the casket lid by tucking the cap panel with a provided
device into a framing area situated about the central area on the lid. The cap panel may be stored
in a frame or packaging pending need for use on a casket. The framed or packaged cap panel
combined with a pillow cover and drape provides a pre-need package for uniquely meeting the
15 specific interests of a person while providing for flexibility of casket selection at the time of
need.
